

Company: Hermann Trollius GmbH

Location: Lauterhofen, Germany

**Transplantation of nutrition-poor
grassland**

The Trollius company is pursuing the goal to increase biodiversity through measures that go beyond obligations laid down in the permit. By this, the structural diversity and the species potential in the area is intended to be stabilised and increased. In the run of time, a vast blooming grassland developed with many species of the former “Häselberg”-hilltop with differences according to the harvesting periods of the hay-seed and area of additional transplantation of sods took place. Just a few years later, the population presented itself as an exceptionally species-rich semi-dry grassland of great importance for flora and fauna.
